On May 22, 1998 this sequence version replaced gi:3126769.
Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          were canonical splice junctions across the splice junctions.

Ď Ş 당 Ş ß δÃ 5#6686868686868686868686868 Query Match Best Local Similarity Macches 1539; Conserv and 427 % proteins are designated IL-13R beta and alpha respectively. The IL-13R beta has high affinity for IL-13 while IL-13R alpha has low affinity; but acquires high affinity when associated with the IL-4 receptor. Nucleic acids encoding IL-13R beta and alpha are used as diagnostic probes to identify aberrant synthesis or genetic anomalies such as loss of heterozygosity and rearrangements, or chromosomal anomalies. They are also used for production of recombinant IL-13R beta and alpha which can be used as IL-13 antagonists, specifically to regulate IL-13-induced responses for treatment of inflammation and of II-13 receptors; when coupled to a toxin also for treatment of averproduction of II-13R. Cells that express II-13R at the surface are used to identify ligands and modulators of III-13R. Note: II-13R beta specification (786464), which is not the same as that shown in the sequence listing (785865) which is not the same as that shown in the sequence 1539 SP: 492 A; 247 C; 335 G; 465 T; This sequence encodes human interleukin-13 (IL-13) beta receptor. The invention relates to new purified peptides comprising 380 or 427 amind acid sequences, which are receptors for interleukin-13 (IL-13); the 38 and 427 as proteins are designated IL-13R beta and alpha respectively allergy. Il-13 receptors are also useful as antisense molecules for gene therapy (blocking synthesis of IL-13R). Antibodies are used (in standard immenoassays) to diagnose diseases associated with abnormal expression Claim 6; Fages 41-42; 83pp; French 121 121 ည 61 attogtitgcttggctatoggatgcttatatacottttotgataagcacaacatttggctg 120 1 ggtgcctgtcggcggggagagagggcantatcaaggttttaaatctcggagacatggctta 60 tgagata/jggattatgaagaga.occggatacttaggttatctctatttgcaatggcaa 240 TACAAGC //TTTGCACTTCATCTTCAGACACCGAGATAAAAGTTAACCCTCCTCAGGATTT ATTCGTTTGCTTGGCTATCGGATGCTTATATACCTTTCTGATAAGCACAACATTTGGCTG tacaagcrittgcacttcatcttcagacaccgagataaaagttaaccctcctcaggattt 180 GGTGCCTCTCGGCGGGGAGAGAGGCAATATCAAGGTTTTAAATCTCGGAGAAATGGCTTA 60 Conservative 100.0%; 0: Score 1539;

PS Claim 6; Figure 2a: 83pp; French CC This sequence encodes human interleukin-13 (IL-13) beta receptor. The CC invention relates to new purified peptides comprising 380 or 427 amino and 427 am proteins are designated IL-13R beta and alpha respectively. CC The IL-13R beta has high affinity for IL-13R beta and alpha are specified in the receptor. Hucleic acids encoding IL-13R beta and alpha are used as cc such as loss of heterozygosity aberrant synthesis or genetic anomalies. They are also used for production of recombinant IL-13R beta anomalies. CC anomalies. They are also used for production of recombinant IL-13R beta and alpha are used as IL-13 induced responses for treatment of inflammation and cc regulate IL-13. receptors are also useful as antisense molecules for gene cc immunoassays) to diagnose diseases associated with abnormal expression. CC of IL-13 receptors are also useful as antisense molecules for gene cc immunoassays) to diagnose diseases associated with abnormal expression. CC overproduction of IL-13R. Cells that express IL-13R hotomatically to the nucleic acid sequence shown in Figure 2a in the sequence listing (785826).

New nucleic acid encoding interleukin-13 receptor binding transformed cells - proteins, antibodies and inhibitors, f treating immunoglobulin E-mediated diseases, e.g. Graves d and in diagnosis.
Claim 1, Pages 32-33; 49pp; English.

The present sequence encodes the human interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known biological activities of IL-13. The present sequence was isolated from human testis library. Recombinant IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to rest igs-mediated conditions, e.g. allergy, asthma and immune complex discriders, especially lupus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in lammatopoietic progenitor cells), cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein of the such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cDNA encoding the human IL-13 binding chain of the IL-13 receptor. Interleukin-13; IL-13; interleukin-13 receptor binding chain; IL-1 mediator; IL-13 receptor binding inhibition; IgE-mediated condition mediator; as immune complex disorder; ds.

Baumgartner JW, Farrah TM, New nucleic acid encoding testis-specific cytokine receptor for identification of ligands or antagonists, potentially for male contraceptives or for infertility treatment claim 1; Page 44-46; 79pp; English.

This cDNA sequence encodes a novel ligand-binding receptor, Zc which shares homology with cytokine receptors and is isolated placental polyA+ RNA. The resulting polypeptide is a receptor sytokines (particularly interleukin-13) and is expressed on the 30-MAR-1998 (first entry)
imman Zcytor2 cytokine receptor cDNA.

Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of testicular cells, probably being involved in spermatogenesis. It comes to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to tree infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions, and as male-specific contraceptives. By blocking the action of II-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in this receptor can also be used to modulate immune function, e.g. in

CC This cDNA clone codes for a novel human cytokine/peptide hormone CC receptor, designated HR-1 receptor (see W41502). Plasmid ATG-531, CC comprising HR-1 receptor cDNA contained in vector pBluescript SK+, CC is deposited in E. coli JM101 as ATCC 98069. The clone was collected from a human testis cDNA library. Also claimed are a cc polypeptide comprising amino acids 1-380 or 22-380 of the 380 cc residue HR-1 receptor amino acids sequence, a vector comprising CC protein and polynucleotide, host cells, an agonist to the polypeptide, and an antagonist cc that inhibits the activity of the polypeptide. HR-1 receptor CC diagnosis and (gene) therapy applications, e.g. to increase cc diagnosis and (gene) therapy applications, e.g. to increase cc and to prevent, ameliorate, treat, diagnose and/or burns, CC predisposition to asthma, allergic discorders or disorders of haematopolesis induced by AIDS, aplastic anaemia, congenital or cc cyclic neutropaenia or as a consequence of cytotoxic therapy of sequence 1288 BP; 421 A; 227 C; 252 G; 388 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                      PT DNA encoding human cytokine-peptide hormone receptor - useful for preventing preventing or diagnosing, e.g. lowered resistance to infection, asthma, allergy, or haematopoietic disease Claim 1; Fig 1; 75pp; English.

CC (HR-1 receptor). This, or it's activators or agonists, can be used to CC treat, prevent or diagnose predisposition to lowered resistance to CC infection, asthma, allergic or haematopoietic disorders, e.g. where CC induced by acquired immune deficiency syndrome (AIDS), aplastic anaemia, neutropaenia or cytotoxic treatments for cancer. Antagonists of the CC conditions associated with overexpression of the HR-1 receptor, e.g. antibodies or fragments of it may be used to treat those listed above. Antibodies may also be used to assay levels of HR-1 receptor, overexpression of which may be diagnostic of tumours, by usual immunoassays; to isolate and identify HR-1 receptor-expressing cells; or CC for affinity purification of the HR-1 receptor. The nucleotide sequence itself may be used to express recombinant HR-1 receptor; as a source of probes for isolating genomic HR-1 clones, PCR primers, diagnostic creagents (particularly to detect gene mutations which may indicate culentification and mapping.

PT Nucleic acid sequence encoding human cytokine peptide hormone Preceptor - useful to treat, prevent or diagnose, e.g. lowered PT receptor - useful to treat, prevent or diagnose, e.g. lowered PT resistance to infection, asthma, allergy or haematopoietic disease CC claim 4; Page 61-62; 76pp; English.

CC cytokine/peptide hormone receptor, designated the HR-1 receptor cytokine/peptide hormone peptide from a human testis tissue CC production of HR-1 receptor, as a source of probes to isolate CC diagnostic reagent (particularly to detect gene mutations which CC dientification and mapping, and in a claimed method for treating CC and agonists can be used to treat, prevent or diagnose CC and agonists can be used to treat, prevent or diagnose CC or haematopoietic disorders, e.g. where induced by AIDS, aplastic CC anaemia, neutropaenia or cytotoxic treatments for cancer.

This sequence encodes a novel ligand-binding receptor, Zcytor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human 2cytor2 cytokine receptor cDNA. Cytokine receptor; ligand binding; testi infertility; antagonist; contraceptive;
                                                                                                                                                                                                                 be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treating intertility. Antagonists of this receptor may be used to characterise ligand receptor interactions and as male specific contraceptives. By blocking the action of II-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor
                                                                                                                                                                                                                                                                                                                                                                          This sequence encodes a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and was isolated from a human testis cDNA library. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1260
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1200

                                                                                                                                                                                                                                      New nucleic acid encoding testis-specific cytokine receptor - useful for identification of ligands or antagonists, petentially for use as male contraceptives or for infertility treatment Example 4; Page 53-56; 79pp; English.

This cDNA sequence encodes a novel ligand-binding receptor, Zcytor2, which shares homology with cytokine receptors and is isolated from testis tissue obtained from a Celebus macaque. The resulting polypeptide is a receptor for cytokines (particularly interleukin-13) and is expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands promoting proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility. Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune cinculating levels of ligand and asto to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as antagonist.

Example 14; Page 50-52; S9pp; English.

The II-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one II-13 activity. They can be used for treating II-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered II-13 after II-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

Disclosure; Page 19-20; 69pp; English.
The II-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one II-13 activity. They can be used for treating II-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered II-13 after II-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in the antagonism of at least one ii-13 activity. They can be used for creating ii-3 mediated conditions such as certain allergic conditions such as sexisimator to inactivate locally administered II-13 after II-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting archimune diseases. The antibodies can also be used for immunotherary and may also be used as a diagnostic tool. The present sequence encodes the murine interleukin-13 (IL-13) binding chain of the interleukin-13 receptor, designated IL-13bc. IL-13bc acts a mediator of the known biological activities of FIL-13. The present sequence was isolated from the thymuses of 6.8 week old mice. Recombinant IL-13bc proteins, and antibodies raised against them, are used to inhibit the binding of IL-13 to its receptor. They are particularly used to treat IgE-mediated conditions, e.g. allergy, asthma and immune complex disorders, especially lupus, nephritis, thyroiditis and Grave's disease. They are also used to treat immune deficiency (particularly in the activity in cancer etc., and to increase macrophage activation, e.g. in vaccination. To potentiate IL-13 activity, a protein with such activity is combined with IL-13bc and the mixture applied, in vivo, to a cell expressing at least one chain of the IL-13 receptor cother than IL-13bc. IL-13bc can also be used in diagnosis to detect expression of IL-13. its receptor or binding chain, and to raise specific antibodies which may be useful for treating some tumours.

                 The II-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one II-13 activity. They can be used for treating II-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered II-13 after II-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for
                                                                                                                                                                                                                                                                                                                                                                                            SGS
